

MegaMix-W

Ready to use PCR mix specially formulated for the Wave[®] Machine

Containing *Taq* polymerase (recombinant) in 1.1x reaction buffer (2.75 mM MgCl₂) with 220 μM dNTPs & stabiliser

For instant and accurate PCRs

Protocol

Thaw the MegaMix-W

Add the desired volume (47 μl or less) into the PCR tube*

Add DNA (1 to 2 μl) and primers (0.5 to 1 μl of each from ~10 μM stock)

Overlay with mineral oil if necessary

Place in a Thermal Cycler

Cycling profile (guide only)

Initial denaturation step: 95°C for 3 mins

Then cycle 25 - 30 times:

Step 1: 95°C for 30 secs

Step 2: Optimal annealing temp. of primers for
30 to 60 secs

Step 3: 72°C for 45 to 60 secs

Cool to room temperature

*Refreeze the rest of the MegaMix-W. It can be frozen/thawed many times without loss of activity
Wave is a registered trademark of Transgenomics Inc, USA
